

Claim

I invented the Finger Safe Shield

The shield is flat rectangular shaped to cover the opening of the hinged side of a door. The shield can be made with many different materials such as plastic etc

The shield dimensions will depend upon the type and size of the door

A shield for a door 6ft 8in. would be 6ft 8in. in height and approximately

4in. wide and 1/8in thick strip of plastic or other material. The shield can be

manufactured many different ways and materials, as it is only a flat rectangular

shape strip of material to mount over the hinged side opening of a door to

prevent children from crushing thier fingers as the door is closed.
